ABSTRACT

“Smart city” narratives promise IoT data-driven innovations leveraging biosensing technologies. We argue this overlooks a potential benefit of city living: affirmation. We designed the Heart Sounds Bench, which amplifies the heart sounds of those sitting on it, as well as recording and playing back the heart sounds of previous sitters. We outline our design intent to invite rest, reflection, and recognition of others’ lives in public space. We share results from a study with 19 participants. Participants expressed feeling connected to a shared life energy including others and the environment, and described heart sounds as feeling intimate yet anonymous. Finally, we elaborate the concept of life-affirmation in terms of recognition of others’ lives, feeling connection, and respecting untranslatable differences with opacity, as a way of helping “smart city” designs embrace a multiplicity of desires.

1 INTRODUCTION

Smart city narratives “aim to evoke positive change and innovation—at least as the proponents see it—via digital ICT; essentially, building an IoT at the city-scale by installing networked objects throughout the urban environment (and even human bodies) for a wide range of different purposes” [142]. These narratives promise improved efficiency, safety, fitness, sustainability, and civic participation, often relying on data [3, 17, 20, 49, 53, 54, 56, 101, 113, 142, 148, 167]. Biosensing technologies—sensors measuring humans and the accompany data, models, predictions, and insights—undergird many smart city IoT applications. For example, video surveillance can detect heartrate [131], correlated with future involvement in violent crime [107] or percentages of joy, contempt, and anger [1]. Wearable trackers promote individual workplace efficiency [9], physical fitness [6], emotional wellness [5, 14], and self-improvement through algorithmically suggested behavioral micro-nudges [150]. Sidewalk Labs plans to revamp citing living with smart city sensing and technology [12, 13, 67, 80, 111]. Knightscope robots patrol parking lots, and sometimes public space, using sensors to detect and report ‘anomalies’ as security risks that often conflate the existence of homeless people with criminal activity [8, 32, 72, 154, 172].

Figure 1: The Heart Sounds Bench amplifies the heart sounds of bench-sitters, inviting a moment of calm yet vibrant life-affirmation.
Critiquing this, Nissenbaum argues that such pervasive surveillance is unjust and tyrannical [124]. Regarding Sidewalk Labs, Crawford cautions against such in-depth intervention by a single company into civic infrastructure [35]. Sadowski and Pasquale critique the smart city ideal, tracing free market ideology that seeks to “spread market logics to all dimensions of human life” while “focusing on the narrow goals of promoting transparency and efficiency” [142]. Our work critiques and explores alternatives to these problematic smart city narratives through design research by engaging the heart sounds bench as a probe [24].

De Lange and de Waal outline a key tension in smart cities: “The challenge therefore in our view is to balance these stories of personalization and efficiency on the one hand and of building collectives based on differences and mutualism on the other hand” [41]. Urban sensing can be used for personalization and efficiency, smoothing over difference for sameness, but an alternative role for urban sensing could be more like visionary urban scholar Jacobs’ call for cities to celebrate “a great and exuberant richness of differences and possibilities, many of these differences unique and unpredictable and all the more valuable because they are” [97, p. 220-1]. Shifting from ‘smart cities’ to ‘social cities’ [41], we contribute a design probing affective experiences of affirmation and connection while respectfully engaging difference.

Widespread biosensing in daily life makes data- and algorithmic judgments about people’s physical unfitness, mental un/wellness, and criminal/terrorist risk [90]. These categories are far from neutral: one side is ‘normal’ and one side is ‘other’. The ‘other’ category is usually seen as sub-optimal, in need of improvement, control, or discipline, or as something to be feared. This can contribute to otherization, a process whereby people come to be viewed as intrinsically different and alien [11, 143] (e.g., racism, Islamophobia). While data-driven approaches including biosensing often claim to escape social prejudice with objective insights, they can instead reify pre-existing stereotypes and bolster structural inequality with a false sheen of scientific authority [3, 15, 16, 27, 29, 30, 52, 125]. Our work engages biosensing in ways that challenge the need for data-driven categorization by presenting heart sounds without filtering or analysis.

Our work sits at the intersection of smart city narratives and affective computing, seeking to reconfigure both. Affective Computing seeks to automatically ‘detect’ human emotions in terms of discrete data-driven categories [31]. This risks flattening difference by claiming that such categories are universally generalized [24], and furthering otherization around emotional un/wellness [90]. At the same time, HCI is undergoing an affective turn whereby research seeks not only to support functional tasks, but also affective experiences, construed more broadly than Affective Computing’s discrete categories of emotion, such as playfulness, reflection, or slowness [62, 76, 123, 128, 152]. Our work investigates how smart city sensing technologies may shape the affective experiences of city living while at the same time challenging the data-driven categorization prevalent in affective computing, by fostering a slow emotional experience with biosensory data that does not rely on data-driven categorization.

Being in public space can fulfill emotional desires not directly related to prevalent smart city narratives. Sometimes people want to get out and about, to see and be seen. As city planners and architects are well aware, the design of urban space influences the kinds of social interactions therein [171]. Contrasting the normative categorization of many urban sensing technologies, we focus on the particular affective experience of affirmation in public space.

2 AFFIRMATION

Affirmation, defined as “emotional support or encouragement” [2], has emerged as a design goal [90, 157, 173]. We outline how affirmation is lacking in prevalent smart city narratives, and contribute the Heart Sounds Bench as a design exploration of affirmation. Listening to one’s own heart sounds, and those of another co-present bench-sitter, invites a quiet moment of listening, bodily awareness, and engagement with other(s). Analyzing the results of our study with 19 participants, we further contribute an elaboration of a concept we name life-affirmation in terms of recognition, connection, and opacity. Recognizing and feeling connected to the life and experience of others contributes to affirmation, while accepting the opacity of what we cannot know about others helps further recognize and affirm difference. We call for designers to continue exploring affective experiences of urban public space while embracing a multiplicity of desires.

Though perhaps not discussed in these terms, affirmation can occur in public space: The bus driver who stops because he sees someone running. The stranger on the bus who moves their bag to make room on the seat, or the one who provides directions. The shopkeeper who greets those entering, before a purchase has been made. Even walking on a crowded sidewalk requires sharing space, acknowledging one another’s needs for passage. Of course, these daily affirmations of one’s existence and needs are experienced unequally depending on privilege. As designers, we draw inspiration from mundane moments of affirmation, while remaining reflexive about our social position and social norms.

Smart city narratives often miss this notion of affirmation. The emphasis on economic exchange constructs its subjects in terms of their ability of to produce economic value by leveraging efficiency and fitness, affirming capital not people. Additionally, biosensing technologies’ potential for otherization, especially regarding criminal risk, is not
affirmative. The Heart Sounds Bench responds to what we feel is a lack of affirmation in prevalent smart city narratives.

The built environment can also feel affirmative. If not intentionally designed to be unpleasant [145], public benches affirm the needs of passerby to sit. Resting may not be not an efficient use of time or part of a fitness regime. Sitting on a bench might lead to being approached by strangers, which could be unsafe. A better economic exchange might require passerby to pay for a seat at a cafe. The Heart Sounds Bench celebrates and leverages the potential of public benches to contest the smart city emphasis on efficiency, fitness, safety, and economic exchange, instead affirming the existence and needs of passerby for a moment of rest.

3 RELATED WORK

Participatory sensing engages citizens in collecting data about civic issues such as air quality or for fostering curiosity, exploration, and discussion [105, 133, 134, 163, 164]. HCI is investigating fostering civic participation with smart city sensing [19, 20, 34, 36, 45, 47, 65, 73, 77, 100, 126, 135, 162]. Boehner and DiSalvo explored how civic tech is conceptualized by civic leaders [25]. Design artifacts can shape Deweyan publics [44] around political issues [48]. Public IoT is oriented toward communities, matters of concern, and matters of care [40, 46]. The Heart Sounds Bench is less about fostering discussion or participation in particular civic issues, and is more about the affective experience of being in public urban space.

Designers and city planners explore affective experiences of citing living. City Lab explores public interventions for building community [149]. Wallace et al. explored the hedonic pleasure of shopping on the high street with the Self-Reflector [168]. HCI has explored fostering community and curiosity in the smart city [22, 28, 132], exploring emotional reflection or emotional bonds with particular places [160, 161, 170], and supporting artistic critical interventions in urban space [59, 60, 104, 106]. Niemeyer’s interactive urban lighting acknowledges passerby with colorful lights that follow them at night [122]. The Heart Sounds Bench builds on these explorations, looking particularly at the affective experience of affirmation.

Perhaps partly due to their affirmative potential, benches have been explored by designers and artists. Rogers’ bold yellow benches provide comfortable seating [140]. Others design benches to encourage social interaction between strangers [42, 81, 103]. Grasso et al.’s interactive bench supports community emotional awareness [74]. Johnson’s film documents the social life of benches [102]. Like other explorations, the Heart Sounds Bench has the potential to foster interactions between co-present strangers, because it can amplify the heart sounds of two sitters simultaneously. While this invitation exists, we also recognize that many might avoid sharing a bench with a stranger due to fear of harassment or violence. So, additionally, the Heart Sounds Bench records and later plays back heart sounds, suggesting a lingering presence to future sitters.

Somaesthetic design fosters directing attention inward for bodily awareness, often in a session set apart from daily life [87]. Somaesthetic design can leverage biosensors to help attune people to their bodies [86, 88, 119, 146]. Often a somatic connoisseur helps participants unpack and articulate their experiences after a session [147]. The Heart Sounds Bench in some ways builds on these practices, amplifying heart sounds to attune people to their own bodies. Yet, public space is immersed in daily life rather than separate from it, and lacks the guidance of a somatic connoisseur.

Listening can invite attention that we wanted to leverage to attune people to their bodies. Public sound art explores playful, critical, and expressive interactions in urban space. This includes mapping sensor input to audio output [61], collecting and looping snippets with a glove-based electret microphone [159], engaging cultural heritages through sound [57, 68, 69], or street art [75]. A variety of networked instruments support multi-person musical collaboration, (e.g., Ten-Hand Piano [21]). Transition Soundings is an interactive public sound installation built into a bus stop [23]. While these projects often explore social interactions or multisensory explorations with sound, the Heart Sounds Bench focuses on exploring the direct sounds of the heart, rather than musical phrasings or the beats per minute typically used in self-tracking.

Biosensing is used to influence sound. Dancers wear biosensors on their bodies that translate their movements, heart rate, or other measures into parameters that are used to generate sound or influence the improvisation of musicians. For example, Jang outfitted a pair of dancers with strangely shaped bone-like back-worn sensors; the dancers gradually accept and explore one another’s atypically shaped bodies [98, 99]. MacCallum and Naccarato explore issues of agency and control using dancers’ heart rate to influence improvisation [109, 119]. Works such as these indicate the rich expressive possibilities of connecting bodies and sound. Our focus was to engage this expressive potential in a much more everyday setting with participants who may or may not have specialized movement or music training.

Oliveros’ Heart Chant was a key inspiration for leveraging sound as a medium. In this participatory performance, people stand in a circle and sing long tones, with one hand on their chest and the other on the back of the adjacent person [127, 129]. The experience is slightly vulnerable because this close contact is atypical of the large personal space maintained in the U.S., and singing feels embarrassing for some. Through this structured, shared vulnerability emerges a feeling of
affirmation as each person’s voice and body are accepted as part of the co-performance.

Biosensing can influence interpersonal interactions. Heart rate has been engaged for physical games [110, 169], board games [55], gauging connectedness in conferencing systems [89], augmented mobile chat [79], or even broadcasting heart rate to online social networks [37]. Howell et al. found that an ambiguous clothing-based display of skin conductance had the potential to foster supportive social emotional reflection, but also to aggravate insecurities [92]. Eriksson et al. explored ritualized tangible representations of heartbeat for bereavement [51]. Slová et al. found that remote heart rate sharing between close pairs in daily life could foster a sense of connection [156]. ReactionBot automatically adds emoji to messages based on facial expressions [108], with the potential to prompt emotional reflection. Snyder et al. probed experiences and interpretations around a color-changing light composite display of a pair’s skin conductance [158]. Engaging the expressive potential of sound, our design presents live unfiltered heart sounds for collocated strangers, not colors, metrics, haptics or visualizations as others do.

4 DESIGNING THE HEART SOUNDS BENCH

The Heart Sounds Bench is a reflective design [152] intended to provoke reflection in both users and us as designers. A reflective design strategy, engaging the bench as a probe [24, 63, 94] helps find experiential possibilities that may emerge with urban sensing. Probes can act as elicitation techniques by fostering alternative experiences with technology [24]. A reflective design output, these experiences and reflections generate concepts and directions for further research. Our approach draws from speculative and critical design that seek to challenge assumptions and spark discussion with provocative artifacts [50, 137, 141], and framings of data as enmeshed in social practices (e.g., [139]).

Interaction Design

The design provides a place to sit and rest, recognizing and supporting the needs of passerby like other benches. Yet, its vibrant color and unusual shape both invite the eye to notice it from afar while hinting at an unusual function.

Bench-sitters’ live unfiltered heart sounds are amplified and played from speakers in the bench, inviting a quiet moment of listening and bodily awareness. We refer to ‘heart sounds’ rather than ‘heartbeats’ to call attention to the continuous sounds of the heart and body, rather than only the discrete beats per minute. Although not technologically novel, we chose to use stethoscopes instead of chair [18], phone [112], non-contact [138], or PPG heart sensors, because stethoscopes give rich heart sounds that provide a sense of unmediated immediacy. Furthermore, the familiar form factor of the stethoscope can help favor informed active consent in future public use. People readily understood the sensor and opted-in by holding it.

With one stethoscope at each arm of the bench, two people can listen to their heart sounds simultaneously. The bench can also record heart sounds and later play these back to future sitters. We wanted to explore how listening to heart sounds could foster a sense of people affirming themselves and others. With two people on the bench simultaneously, we could explore the potential for affirming a co-present other. We relate this to moments of city living when we acknowledge the co-presence of a stranger, such as while sharing space on the bus. With the prerecorded playback, we could probe the potential for affirming an absent other. We related this to moments in city living when we acknowledge the presence of those who came before based on the traces they left behind, such as tags or stickers. This prerecorded audio also included a voice stating the date, time, and weather. The date and time were included to indicate that these heart sounds came from the past. The weather was included to give some sense of context and invite participants to reflect on the environment around the bench. While no voice is neutral, we asked a professional therapist to read these details in a calm tone, because we felt his voice was particularly well tailored for prompting open-ended emotional reflection.

System Design

At each side of the bench is a listening piece, an amplifier circuit, and a speaker. The listening piece is a modified stethoscope affixed to an electret microphone [95]. This connects to an audio amplifier [96]. The amplifier circuit connects to a speaker [7, 10]. The sounds from each stethoscope play through speakers on the corresponding side of the bench. The live real-time amplification of heart sounds is instantly responsive and recognizable as heart sounds. In addition to heart sounds, the stethoscopes are essentially a general-purpose microphone that also pick up rustling, tapping, and the vibration of people’s bodies as they speak. The electret microphone receives a quiet steady DC voltage from 3 AA batteries in series. The amplifier circuit is powered by 5V DC from a wall adapter. Blankets folded on the arms of the bench reduce the medical feel of the stethoscopes and provide sound dampening between stethoscope and speaker to prevent feedback.
While bench-sitters’ heart sounds were live via fully functional electronics, we used a Wizard of Oz technique to play back the heart sounds of a previous sitter. From a mobile phone connected to a speaker [4], we played back the same prerecorded heart sound for all participants. This enabled us to probe participant experiences of hearing the playback and speculating on how they would feel about being recorded. Future work on the Heart Sounds Bench can implement recording and playback as well as designing an intuitive way to choose when to record and when to play back.

5 STUDY

Our goal with this study was to probe affective experiences of sensing and affirmation. For this first trial, we wanted to give a sense of public space and unstructured time experiencing the design, while ensuring ability to focus on heart sounds without distraction. So, although we are interested in public space with all its vibrancy and risk, for this first stage of the project we chose to study participants’ experiences with the bench indoors. Conducting the study inside in a private room enabled us to more deeply probe how people interpreted and reacted to the design. The private setting ensured that audio and video recording did not capture any unsuspecting passerby, an important ethical consideration for us.

The study setting provides some sense of public space. On the bench, participants sat less than 1m away from a crowded pedestrian thoroughfare via large corner ground level windows through which squirrels and birds sometimes enter. Yet, they also had space to clearly hear their heart sounds. So, the room evokes a sense of having a quiet secluded corner viewing a larger outdoor space.

Participants came in pairs to probe how they experienced hearing their own heart sounds, those of a co-present other, and the prerecorded playback of an unseen other. After a few introductory questions by the researcher that began to build rapport between participants, the researcher left participants sitting on the bench alone together in the room for about 20 minutes. About halfway, the researcher played the prerecorded heart sounds of the absent other. Returning, the researcher conducted a semi-structured interview with the pair about their experiences and interpretations with the heart sounds for about 45-60 minutes. Recruitment was conducted over organizational and public-facing mailing lists and communication platforms. Audio and video recordings of participants were transcribed for analysis and coded to find emergent themes [33]. Participants are referred to by pseudonym.

Future work will study the system in public. The indoor study focused on in-depth emotional reflection 20 minutes of experiencing the bench without distraction and 45-60 minutes of emotional reflection afterward. In public the duration of participation and depth of reflection will likely be less, while the larger N study of public behavior can surface trends and unexpected uses.

6 FINDINGS

Nineteen people participated (9 women, 10 men, mid twenties to mid thirties). Pairs were strangers, coworkers, or friends. Three participated alone due to scheduling issues. Most participants alternated between quietly listening to their heart sounds and chatting with one another about the experience. Sometimes they took turns listening to their heart sounds one at a time. In describing their experiences, participants often cited nearby elements of public space such as passerby, trees, squirrels, sounds, and the sunset, indicating that the study setting did evoke some sense of public space for participants.

Life Energy

Several participants described feeling connected to a life energy or sense of being alive. Some focused on their own vitality, others on a sense of connection within the pair, while a few felt a sense of connection including themselves, others, and the environment.

Sally connected hearing her own and others’ heartbeats to a sense of life pulsing through herself and others.

“It’s a nice reminder of what’s pulsing through everybody. It’s nice to be able to hear somebody else’s heartbeat, just makes you that much more aware of that you’re around somebody else who’s living and breathing.” Later she added, “It just seems really sweet to me to hear that, to hear somebody else’s, the life pulsing through them.”

She described first a growing awareness of her own body, then expanding her attention outward to an appreciation of the lives of others. While much HCI work with heart rate and the smart city focuses on fitness, participants’ reflections on appreciating and feeling connected to the lives of others point to a distinct design opportunity.

In imagining public use of the bench in the future, Charlie envisioned feeling more involved in the moment, the environment, and the world.

“If it’s outdoors, I think it would make me feel more involved in the moment, like involved with the environment. When I’m listening to my heart sounds, watching the gate [gestures to scenery through the window], it would make me feel more involved with the environment... Listening to the sound is like, there’s many metaphors about your heartbeat beating with the same thing around the world... like the heart beating with the world... which makes me feel involved with this world, and more enjoy at that moment.”
He described feeling present in the moment with his own heart beating in connection with the world. This sense of presence and connection suggests an affective experience that could be explored in designing for the smart city.

Jay built on his study partner Charlie’s sense of involvement and reflected on a sense of connection with nature. “This seemed like I was more connected, even if it was just in this room, I felt it seemed like it was extending outside of myself... I [felt connected to] the world around me. And that something so internal and personal could have an effect on others around me. Even though it was seemingly just you [gestures to his study partner], but perhaps maybe someone could hear it outside [through the windows], or I guess just in the way that [pause] trees just moving and we can kind of tell other things in the earth are doing or making other sounds or other sensory messages. It seemed like I was doing that too... The fact that we’re embedded within nature and doing this [the Heart Sounds Bench] gave it kind of like an outside perspective of seeing myself as one and the same as other beings or other objects that also do that... that also show their signs of life.”

Like others, John draws a connection between heart sounds and life energy. Again, distinct from a prevalent focus on physical fitness, this sense of ‘life force’ was a remarkable affective experience for many participants.

Odile focused more on her own sense of being alive. “I think the rhythm of my heart being so steady reminds me... that I am alive.” Odile went on to describe how this reminder helped calm her and make her feel like she could manage her stress. Again, the association between heart sounds and vitality came up for many participants.

The connection between heart sounds and being alive makes sense given that the heart is essential to our biological life. Though this is a basic fact, the affective dimensions of being reminded of this seemed to be a remarkable experience for many participants. Feeling more connected to oneself or one’s study partner seems to have been meaningful and enjoyable for several participants. While heart rate sharing has been previously found to foster a sense of connection [156], what surprised us were the multiple instances where participants described a broader sense of connection extending to many other people, the environment, the world, even trees and objects. We speculate that what might have contributed to this sense of broader connection is the externalization of the heart sounds through the speakers, as well as the ground level view out the windows onto trees, sky, and passerby. The Heart Sounds Bench centers the individual by helping them attune to their own heart sounds, expands this to a dyad, and then further amplifies this awareness through the broader environment.

In contrast to smart city sensing technologies that construct people in terms of economic value, safety threat level, or other models and categories, our design called attention to a shared embodied experience of being alive. Participants
seemed to find this sense of shared life energy to be a meaningful and compelling experience, pointing to future opportunities for designs exploring this.

**Vulnerability of Life**

The stethoscope reminded several participants of prior experiences with stethoscopes such as doctor or hospital visits. For example, Sheena said she was reminded of medical emergencies when stethoscopes have been used on her. She arrived at the study just after a frightening experience on the subway. The Heart Sounds Bench seems to have aggravated her stress by bringing back bad memories.

Jay also related the heart sounds to worrying about ‘mortality’, as he put it. Speculating future public uses of the bench, Jay imagined worrying about the deteriorating health of older relatives.

“As much as this can be an intimate experience, it could also be a disturbing or scary experience because... hearing the heart sounds of someone else, or even your own... Say I were to go with my father or an older member of my family, and essentially we’ve walked or something, and I hear their heart beating really fast. That can be a really quick reminder of their mortality, or in many ways engaging with someone else’s health in a way that might be kind of frightening, and it might change the relationship between you and that person.”

An unexpectedly fast heartbeat could indicate frightening health concerns in a loved one. Heart sounds served not only as a reminder of being alive, but also as a reminder of the vulnerability of life. This seems related to both the medical associations of the stethoscope and the heart’s essential cardiovascular function.

**Intimacy**

Several participants described hearing their study partner’s heart sounds as intimate. In describing listening to her study partner’s heart sounds, Amanda said, “It’s weirdly intimate, like I don’t know this person but I’ve heard an organ that keeps them alive.” Others were reminded of intimate moments with a romantic partner, with an ear to their chest listening to their heart sounds. The stethoscope’s live unfiltered heart sounds are extremely similar to what one hears by pressing an ear to another’s chest. Some products for long distance couples sonify heart rate (e.g., [117]), and Slovák et al. found remote heart rate sharing to foster connection [156]. Yet, the unique richness of live unfiltered heart sounds rather than heart rate sonification could be more widely leveraged in designs.

**Anonymity**

Co-present study partner. Listening to the heart sounds of the co-present study partner seemed to feel both intimate and anonymous. While participants often expressed that it felt special or unique to hear such an essential sound from another person that they would not normally hear, at the same time they sometimes reflected on how this sound could also feel anonymous. Amanda, who described hearing her study partner’s heart sounds as “weirdly intimate”, also reflected, “I wouldn’t know one heartbeat from another or my own.” Her study partner Nathan added, “I sort of felt similarly that, any heartbeat, I didn’t have like a clear distinction about which one was mine or what it meant about someone else... kind of anonymous.” Some participants speculated they would not be able to identify their own heart sounds or their study partner’s from a selection.

Absent other. In addition to the live unfiltered heart sounds of study participants, we included playback of the heart sounds of an ‘absent other’ who previously sat on the bench. The playback began with a voice stating the time, date, and weather. Listening to the absent other’s heart sounds was mostly experienced as anonymous and not intimate. Kusha reflected, “With the heart sounds that were prerecorded, I was trying to build a story and imagine a person.” Her study partner John added, “I was much more interested in hearing [Kusha’s]... I think I could have felt more connected to [the absent other’s playback] if instead of just the date and the time there was some explanation of what the person was going to be doing...” Jay described it as “disembodied”. Participants often wondered what the absent other was feeling or doing, but struggled to build a narrative. They linked this lack of context to not feeling connected with the heart sounds of the absent other. Nathan summarized, “I didn’t know anything about that person or their context. It just seemed like an anonymous recording.”

**Calming**

Many participants described the experience as calming. Odile used the word ‘calm’ repeatedly to describe her experience. Kusha said she began the study feeling stressed, but then the heart sounds help her calm down. Participants also linked their experience of calm with seeing trees or the sunset through the window, and often suggested placing the bench in a park to enhance its calming potential. Although the researcher stated they were free to take breaks, chat, and put down the stethoscope, many participants sat quietly listening to their heartbeats. For many this seemed to be a calming experience.
Other Themes

Estelle, an electroacoustic musician, explored the Heart Sounds Bench as a feedback instrument. Many electroacoustic instruments operate on this principle: A feedback instrument relies on feeding the output (in our case, speakers) back into the input (stethoscope), often with amplification increasing intensity. The feedback loop is mediated by physical materials, so subtle adjustments (in location of stethoscope on bench) create nuanced expressive sounds. She described it in terms of cybernetics and how tools or musical instruments can serve as extensions of the body. Some participants playfully experimented with the system, tapping on the stethoscope or using it to amplify their voice. Energetically amplifying not only the heart but also whatever the stethoscope encounters may have contributed to the sense of shared life energy by fostering attentive listening to unexpected sounds of both humans and materials.

Almost all participants spent a few moments finding the right spot on their chest to listen to their heart sounds. For a few, this took several minutes and was frustrating. Yet, this searching could also contribute to growing one’s bodily awareness, which was seen as valuable by some.

A few participants related the bench to meditation. Kusha described how she had been focusing on her heart during meditation, and the heart sounds helped her with that. Alan said he would want the system in his home so he could use it for daily meditation. Rohit said he has been trying to meditate more often and felt the system could be a helpful aid. Perhaps along a similar vein, many participants described the experience as calming, contemplative, centering, grounding, or talked about being in the moment.

When asked how they would feel about their own heart sounds being recorded and played back later after they were gone, almost all participants wondered whether heart sounds could be individually identifiable, citing this as a key consideration. They also expressed concerns about whether heart sounds in combination with other data such as video surveillance could become individually identifiable, or reveal unexpected insights about them. Deploying the bench in public space, it is essential to consider how the bench could potentially become an unwanted form of surveillance.

7 ELABORATING LIFE-AFFIRMATION

Synthesizing our findings and design intent, we elaborate on the concept of life-affirmation in terms of recognition, connection, and opacity. In accordance with designerly modes of knowledge production [64], this is not intended as a generalizable definition. Rather, by elaborating one particular conception situated around a particular design, we hope to open a path for others to continue exploring this concept. We do not claim that our bench currently supports life-affirmation in public because this is as yet untested; rather we contribute life-affirmation as a promising direction for future design exploration in public space.

The Heart Sounds Bench seems to have fostered a particular kind of affirmation we call life-affirmation. This life-affirmation can spread outward from self, to study partners, to other people and the natural environment. Participants described feeling reminded that they are alive, and feeling more drawn into themselves and connected with their body. They described being reminded that their study partner is living and breathing too, and the strange intimacy of hearing their heart sounds. They described feeling more connected to “what’s pulsing through everyone” (Sally), “the heart beating with the world” (Charlie), and “seeing myself as one and the same as other beings or other objects that ... show their signs of life” (Jay). There is a sense of shared vitality, that multiple beings are partaking in a similar process of living. Though at some level this is an obvious observation, the affirmation of this shared vitality creates a particular feeling participants found remarkable. We call this life-affirmation.

Revisiting our initial critique of smart city narratives, we see life-affirmation as a key element often neglected by an emphasis on efficiency, fitness, and safety. Being in public can provide a joyful sense of shared vitality, of seeing others and being seen. There is a unique pleasure to being in the midst of the hustle and bustle of a crowded, chaotic city street. This affective experience is an important aspect of city living that should not be overlooked in the push for efficiency, fitness, and safety.

The life-affirmation experienced with the Heart Sounds Bench seems to stem from sitting outside the action rather than being immersed in it. For the study, participants sat inside looking through ground level windows at a campus thoroughfare crowded with people streaming by. They often gazed through the windows or gestured toward them during the interview. Participants often suggested putting the bench in a quiet area outdoors with a view of natural scenery. Taking a step back from the action seemed to facilitate centering on oneself, before expanding that sense of connection outward to other people and the environment.

Life-affirmation is a conceptual tool that helps address calls to build connection while respectfully engaging difference (e.g., [41]). We elaborate three key aspects of life-affirmation—recognition, connection, and opacity—that contribute to its conceptual potential.

Recognition

Much work ‘recognizes’ normative categories of a person, flattening difference into categories. Instead, we call for recognizing others’ existence and feelings as valid. Life-affirmation involves a kind of recognition distinct from the recognition typically sought by biosensing technologies,
which often seek to recognize discrete emotional categories (e.g., [26, 83, 136, 144]), or identify or authenticate an individual based on biosensory data they give off (e.g., [38, 39, 58, 82, 93, 115, 116, 155]).

In contrast to that kind of recognition, participants described being 'reminded' or being 'more aware' of something they already knew: that they and others are alive. Recognizing this is technically trivial, but seemed to be a meaningful affective experience for participants. The biosensory data people give off, or "the signs of life" (Jay) that humans and plants alike give off, can contribute to life-affirmation. San Leandro Lights are another example of urban sensing that supports this notion of recognition: These street lamps create beautiful pools of light that follow pedestrians using sensors [122]. There is an opportunity for smart city biosensing to design for recognition. This recognition need not take the form of specific data-driven categories; rather, a focus on simply recognizing or acknowledging people’s existence, feelings, and experiences could support life-affirmation.

Connection

Connection is not unique to our work. Yet, life-affirmation offers a unique way to build connection between strangers while respecting difference. Recognizing this shared vitality led to a greater sense of connection for many participants. Slovák et al. also found heart rate sharing to foster social connection [156]. There, a sense of connection emerged within pairs of colleagues and cohabitant couples. In our study, participants described feeling more connected to their study partner as well as to other people, the environment, or the world more broadly. This seemed to stem from a sense of going sharing a similar life process as others, providing a sense of commonality. As another example, Hein’s Modified Social Benches encourage social interaction between strangers [81]. Smart city sensing technologies tend to frame people as atomized individuals [90, 121, 142]. Connection and life-affirmation point to an opportunity for biosensing designs to emphasize social interconnection, as some work with self-tracking has already begun to do (e.g., [120]).

Opacity

While we celebrate the sense of connection of feeling “one and the same as other beings or other objects” (Jay), it is essential to recognize not only our commonality with others but also our difference. Our adaptation of Glissant’s notion of opacity can help respect difference and support other ways of knowing. Opacity resists a tendency to build connection by understanding the ‘other’ via reducing them to hegemonic categories. A contemporary of Fanon, Glissant was a postcolonial philosopher and poet who analyzed Caribbean Creole’s complex relationship with the language of the colonizer. In his essay ‘For Opacity’, Glissant argues for the right to opacity as a way of acknowledging difference while avoiding the reductive problem of transparency [70].

“If we examine the process of ‘understanding’ people and ideas from the perspective of Western thought, we discover that its basis is this requirement for transparency. In order to understand and thus accept you, I have to measure your solidity with the ideal scale providing me with grounds to make comparisons and, perhaps, judgments. I have to reduce... I relate it to my norm. I admit you to existence, within my system.” [70, p.189–190].

Understanding is often approached via transparency, which requires reducing the other to predefined terms or categories. This route to recognition affirms only a reduced representation of the other in terms of hegemonic norms. Glissant further problematizes understanding (comprender) as taking or appropriating and proposes gives-on-and-with (donner-avec) as an alternative [71], but here we focus on opacity.

For smart city sensing, transparency is often valued as a way to build trust in the smart city [56]. Perhaps if we could know more about each other, we could fear each other less and affirm each other more. Yet, smart city sensing is a particular way of knowing that privileges particular norms and categories. We should not have to make ourselves legible in terms of hegemonic data-driven categories in order to be affirmed. In that translation too much is lost or reduced. Opacity resists transparency.

Opacity is distinct from privacy. While “privacy is an essentially contested concept” [118], its conceptualization often foregrounds appropriate information flows or the right to not be bothered [124, 151, 166]. In contrast, Opacity foregrounds ways of knowing, problematizing the production of ‘information’ in terms of predefined categories. We call for smart city technologies to more critically and reflexively engage the knowledge politics of their sensing and inference.

Opacity is related to, but distinct from, ambiguity of information [66]. Since Gaver et al.’s foundational paper on ambiguity, many information displays have leveraged ambiguity to prompt open-ended reflection. A display’s lack of clarity can prompt users to ‘supplement’ this with their own contextual knowledge for interpretation. We see ambiguity as a valuable approach, and indeed much of our prior work engages ambiguity in data display [43, 91, 92]. Opacity similarly presents the user with a lack of clarity, but for a different purpose of acknowledging the limitations of our own understanding. To those not trained in auscultation, heart sounds are somewhat opaque and users did not seem to form specific interpretations of this data.

A comparative example is Affector, which shows abstract ambient ambiguous video feed of a coworker in their office.
Aflutter is framed around ambiguity. As described by the designers, “In order to support reflection on both emotion and the role technology plays in it, Aflutter is deliberately designed to communicate emotion obliquely and enigmatically. It does not provide easy answers to how someone feels today; instead, it provides indirect evidence which users must interpret with reference to the data supplied by the system, as well as background knowledge of their friendship and contextual cues” [153, p. 351]. The ambiguity prompts users to supplement the data with their own contextual knowledge to form interpretations. Yet, the intended users likely can only guess at how their coworker feels. The ‘oblique’, ‘enigmatic’, or opaque design foregrounds the limits of our own ability to know others.

Data-driven insight is valorized in our current moment, but opacity argues for acknowledging the limitations of our knowledge of others. This joins our past work calling for humility in knowledge claims made with emotional biosensing [90] as well as related work calling for contestability in knowledge claims made with emotional biosensing [84, 85]

Taken together, recognition, connection, and opacity contribute to life-affirmation, forming a novel conceptual tool to help reframe sensing’s role in urban life, from smart cities to social cities. We reworked the concept of recognition away from recognizing data-driven categories toward recognizing others’ lives, experiences, and feelings. This centers the affective experience of recognition rather than data-driven insight or predictive potential. We describe a sense of connection that can emanate outward from self-attunement, to a co-present other, to many others across the world and the natural environment. While celebrating this sense of shared vitality and commonality, we also introduce opacity as a way of respecting difference. Opacity reminds us that we cannot know others entirely, and holds space for different ways of knowing that do not neatly translate.

8 LIMITATIONS
Conducting the study inside in a private room, though it enabled us to more deeply probe participants’ experiences, hindered our ability to probe affective experiences of being in public. Most participants came from a similar age group and educational background, limiting our ability to engage questions of otherization woven throughout our argument. In future work deploying the bench in public, we hope to explore interactions where people might feel more ‘other’ to one another. Yet in public, two strangers sitting on the bench simultaneously listening to their heart sounds seems unlikely, given legitimate concerns around harassment. Future design iterations will continue to explore how the heart sounds of an absent other can be more evocative and engaging. Finally, life-affirmation does not solve problems. It does not address important issues such as sustainability or violent crime. Yet, it is still worthwhile to explore how urban sensing will shape affective experiences of city living.

9 FUTURE DESIGN DIRECTIONS
Future design directions should continue to explore affective experiences with urban sensing, embracing a wide variety of feelings and desires. As anthropologist/geographer Harvey [78] puts it,

“The question of what kind of city we want cannot be divorced from that of what kind of social ties, relationship to nature, lifestyles, technologies and aesthetic values we desire.”

Rather than trying to converge on a common set of social ties, lifestyles, etc., urban sensing should explore a multiplicity of desires for vibrant social cities. These efforts at inclusivity and diversity have already begun (e.g., [114, 130, 165]). We contribute life-affirmation as one feeling to explore, elaborating this in terms of recognition, connection, and opacity for celebrating and respecting both commonality and difference.

10 CONCLUSIONS
We contribute the design of the Heart Sounds Bench to explore an often-overlooked potential for affirmation in city living. Our key contribution is life-affirmation as a conceptual tool for reworking smart city narratives. We do not claim that our design currently supports this in public (as yet untested); rather we contribute life-affirmation as a promising direction for future design exploration in public space. Nineteen participants’ insightful articulations of their experiences help us elaborate life-affirmation in terms of recognition, connection, and opacity. Recognizing others’ lives, feeling connected, and embracing difference with opacity can be a meaningful affective experience of life-affirmation. Future designs with public urban biosensing technologies should explore a wide variety of affective experiences and a multiplicity of desires.

ACKNOWLEDGMENTS
Thank you to the reviewers and participants, and to the many people surrounding the lead author who provided affirmation: Prof. John Chuang affirmed my research interests before either of us knew what I was talking about. Richmond Wong and Nick Merrill provided constant conversation thinking through ideas. Electroacoustic musicians Bennett Sheaffer, Seiyung Jang, Alex Cohen, and Crank Sturgeon provided much needed technical advice while believing in my ability to wrangle the noise. Gary Gin helped debug electronics and choose the right power supply. Imani Wilson devoted hours of time to help paint the bench. Ryan Albertson provided woodworking tips. Jose Buenrostro lent his voice to introduce the prerecorded heart sounds. Franky Spektor, Elizabeth Resor, Jeremy Gordon, Joyce Lee, and Cesar Torres modeled
for photo/video shoots on very short notice. Nitin Kohli and Kevin (Rundong) Tian helped with testing and ideation and helped haul the bench around.
